

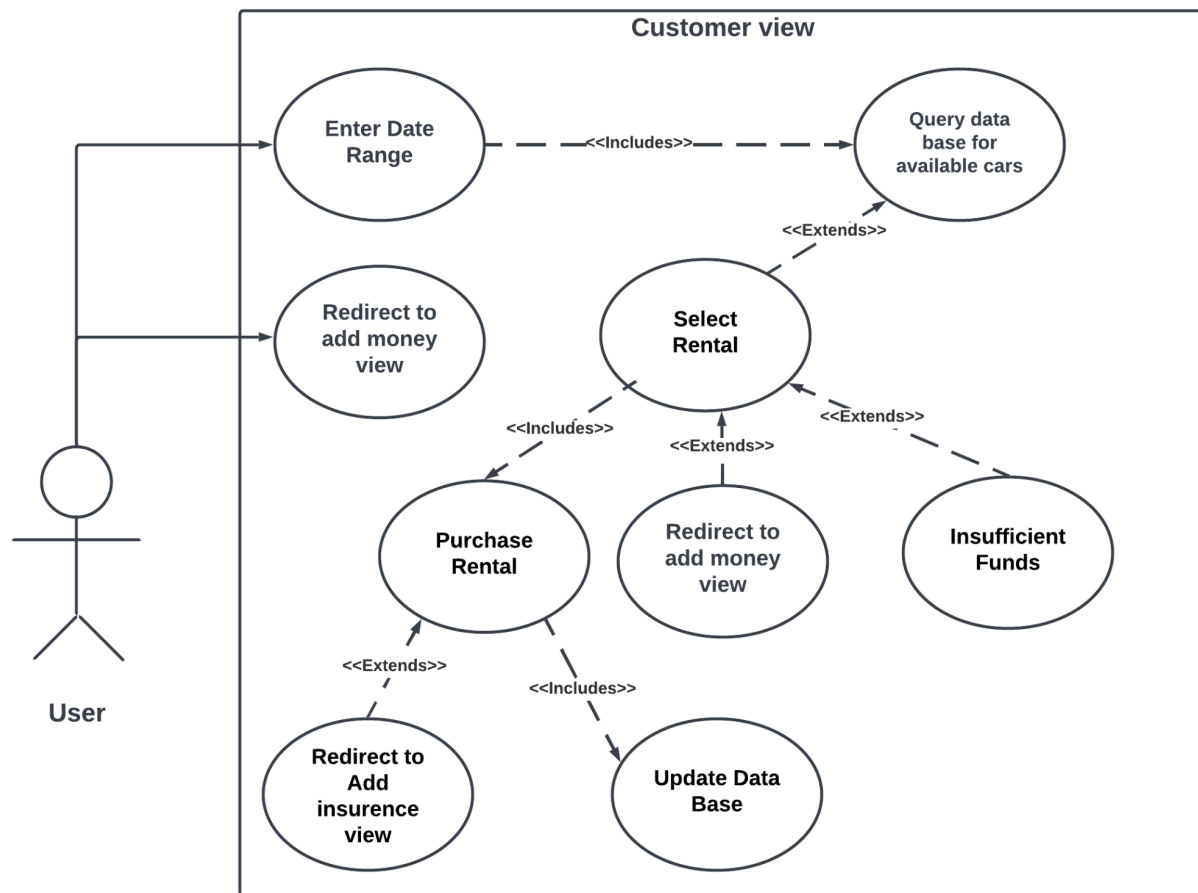

Figure 2: Customer page

Participating actor: User (Customer)

Entry Conditions:

- Customer wants to rent a car on a specified date
- Customer wants to add money to their account

Exit Conditions:

- Customer has selected a car for a certain date, this is updated in the database
- Customer decides to add insurance to rental, the customer is then redirected to the insurance page.
- Customer has insufficient funds, and decides not to rent.
- Customer has insufficient funds, and decides to add money to the account.

Event Flow:

1. The customer enters the range in which they would like to rent a car.
2. Or the customer would like to add money to their account. They are then redirected to the add funds page.
3. If there are any available cars in their selected date range, the user can then select a car they would like to rent.
4. They can then purchase this rental.
5. If there are insufficient funds, the user can cancel or add money to their account.
6. If the purchase is valid, then the customer can add insurance to their rental.
